To calculate cryptographic hashing value in Java, MessageDigest Class is used, under the package java.security.
MessageDigest Class provides following cryptographic hash function to find hash value of a text, they are:
MD5
SHA-1
SHA-256
This Algorithms are initialize in static method called getInstance(). After selecting the algorithm it calculate
the digest value and return the results in byte array.
BigInteger class is used, which converts the resultant byte array into its sign-magnitude representation.
This representation converts into hex format to get the MessageDigest
Examples:
Input : hello world
Output : 5eb63bbbe01eeed093cb22bb8f5acdc3
Input : GeeksForGeeks
Output : e39b9c178b2c9be4e99b141d956c6ff6

Implementation:

```
import java.math.BigInteger;
import java.security.MessageDigest;
import java.security.NoSuchAlgorithmException;

// Java program to calculate MD5 hash value
public class MD5 {
	public static String getMd5(String input)
	{
		try {

			// Static getInstance method is called with hashing MD5
			MessageDigest md = MessageDigest.getInstance("MD5");

			// digest() method is called to calculate message digest
			// of an input digest() return array of byte
			byte[] messageDigest = md.digest(input.getBytes());

			// Convert byte array into signum representation
			BigInteger no = new BigInteger(1, messageDigest);

			// Convert message digest into hex value
			String hashtext = no.toString(16);
			while (hashtext.length() < 32) {
				hashtext = "0" + hashtext;
			}
			return hashtext;
		}

		// For specifying wrong message digest algorithms
		catch (NoSuchAlgorithmException e) {
			throw new RuntimeException(e);
```

```
            }
        }

        // Driver code
        public static void main(String args[]) throws NoSuchAlgorithmException
        {
            String s = "GeeksForGeeks";
            System.out.println("Your HashCode Generated by MD5 is: " + getMd5(s));
        }
}
```

Output:
Your HashCode Generated by MD5 is: e39b9c178b2c9be4e99b141d956c6ff6
